Education

Beijing Institute of Technology

Beijing, China

- **Ph.D. Student** of Information and Communication Engineering
- Successive Postgraduate and Doctorial Program
- Co-supervised by Prof. Jun Zhang (Member of Chinese Academy of Engineering) and Dr. Liheng Bian

2020.09 – present

Nanyang Technological University

Singapore

- Visiting **Ph. D. Student**

2024.10 - 2025.10

Xidian University

Xi'an, Shaanxi, China

- **B.S.** in Computer Science and Technology

2016.09 - 2020.06

Work Experience

Research Intern, Alibaba Group

2019.06-2019.10

- Developed a lip-reading system based on LSTM.
- Received the honor of **Outstanding Intern**.

Research Interest

My current research interests are mainly about **computational imaging and sensing**. Specifically, I focus on deep-learning-based imaging and sensing techniques in complex environments. Also I investigate deeper with various novel self-attention mechanisms and loss functions to improve the performance of the imaging and sensing networks.

Awards & Honors

- | | |
|--|------|
| • The Special Grade Graduate Scholarship (5%) | 2023 |
| • The Special Grade Graduate Scholarship (5%) | 2022 |
| • Third place in Mobile Intelligent Photography and Imaging (MIPI) challenge (ECCV Workshop) | 2022 |
| • Excellent Graduation Thesis of Xidian University | 2020 |
| • First Prize in the China Undergraduate Physics Tournament (CUPT) | 2018 |
| • Silver Medal in the International Collegiate Programming Contest (ICPC) | 2018 |

Research Experiences

Computational Imaging and Sensing

I focus on large-scale single-pixel imaging and sensing (SPIS) technique that enables high-quality single-pixel imaging and highly efficient image-free sensing with a low sampling rate.

- Proposed a small-size optimized pattern sampling method which achieves better sampling performance with fewer pattern parameters (\sim one order of magnitude).
- Reported a novel uncertainty-driven loss function to train the SPIS network. It can reinforce the network's attention to the texture-rich regions and edge regions, thus improving the imaging and sensing performance of these regions.

Large-scale Single-photon Imaging

I focus on the great challenge of high-fidelity imaging using single-photon avalanche diode (SPAD) array in extreme low-light environments.

- Studied the complex photon flow model of SPAD electronics to accurately characterize multiple physical noise sources, and collected a real SPAD image dataset to calibrate noise model parameters.
- Built a deep transformer network with a content adaptive self-attention mechanism and gated fusion modules, which can dig global contextual features to remove multi-source noise and extract full frequency details.

Underwater Image Enhancement (UIE)

- Proposed a novel U-shape Transformer dealing with the UIE task, in which the designed channel-wise and spatial-wise attention mechanism based on the transformer enables to effectively remove color artifacts and casts.
- Designed a novel multi-color space loss function combining the RGB, LCH and LAB color-space features, which further improves the contrast and saturation of output images.
- Released a large-scale dataset containing 4279 real underwater images and the corresponding high-quality reference images, which facilitates further development of UIE techniques.
